

Valuing Uncertainties in Wind Generation

An Agent-Based Optimization Approach

Forecasts for wind & solar come with *uncertainty*.

Each MW has a different *likelihood of actually being available*, so each MW has a different value.

We value each MW of wind based on the anticipated system price conditions and wind uncertainty...

And simulate the effects when wind generators apply this offer strategy in a test 73 bus system (RTS-GMLC).

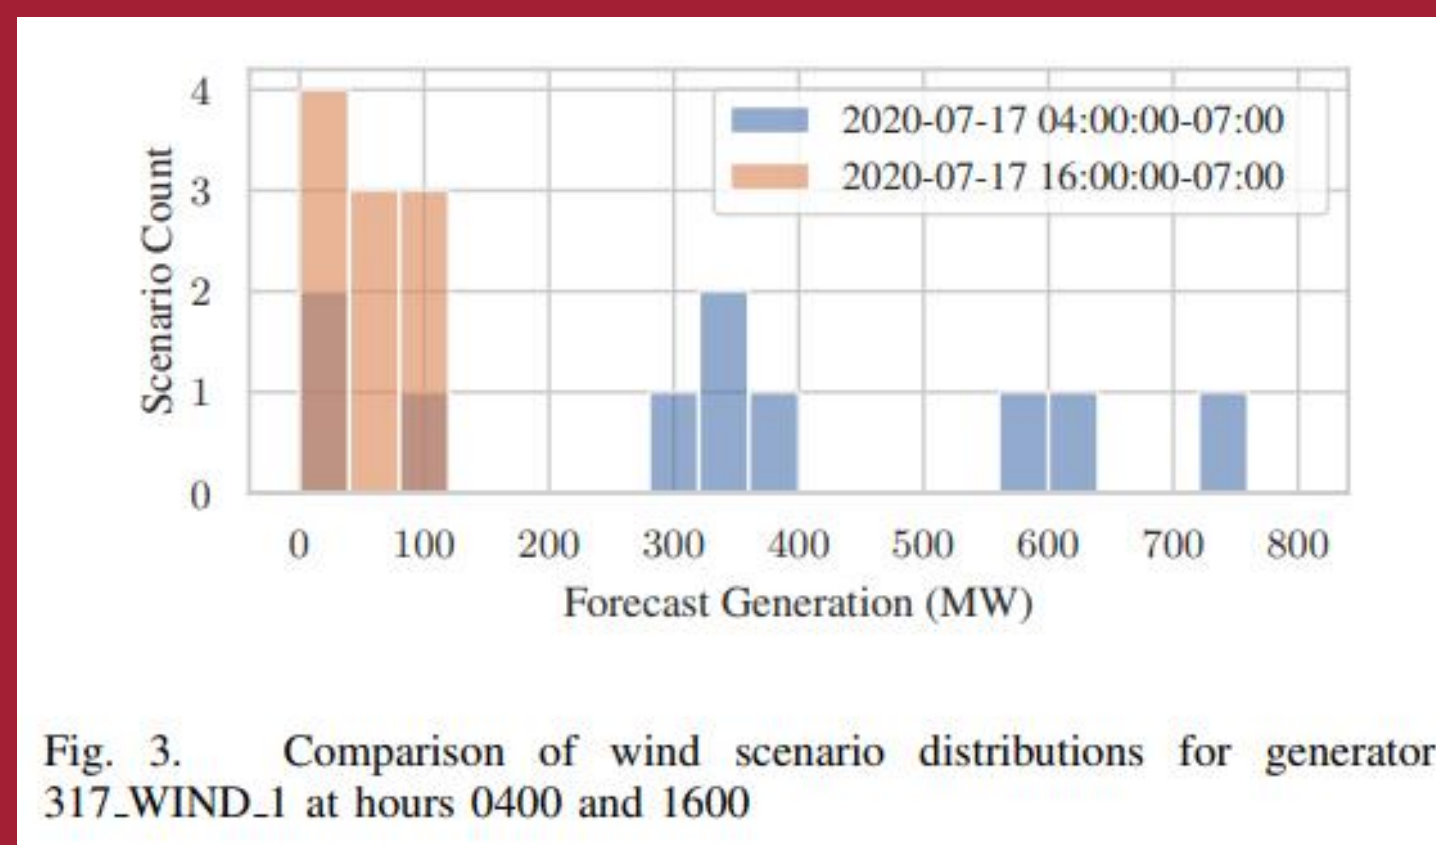

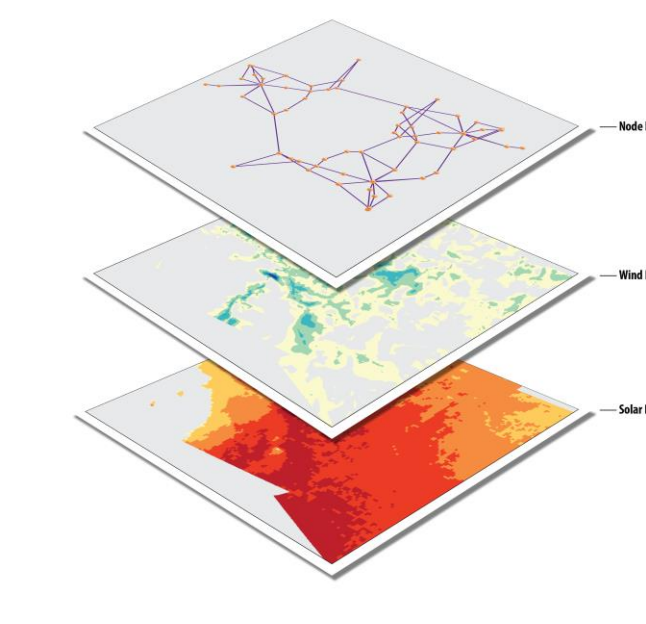

Fig. 3. Comparison of wind scenario distributions for generator 317.WIND.1 at hours 0400 and 1600

Background

- Variable Renewable Energy (VRE) has zero fuel costs but more uncertain delivery characteristics
- While forecasts for these resources are improving, there will always be uncertainty in the forecasts; we could be 99% confident in the first 50MW forecast block but only 30% confident of the next 10MW.
- What if the energy offers reflected the firmness of each MW instead of solely variable costs such as fuel?

Results

| Generation | Total capacity (RTS-GMLC) | Count | Keep? | Final % |
|--------------------|---------------------------|-------|-------|---------|
| Gas (CC) | 3550 | 10 | Yes | 31 |
| Wind | 2508 | 4 | Yes | 22 |
| Coal | 2317 | 16 | Yes | 20 |
| Gas (CT) | 1485 | 27 | Yes | 13 |
| Hydro | 950 | 19 | Yes | 8 |
| Nuclear | 400 | 1 | Yes | 3 |
| Oil (CT) | 240 | 12 | Yes | 2 |
| Oil (Steam) | 84 | 7 | Yes | 1 |
| PV (Utility) | 1555 | 25 | No | 0 |
| Rooftop PV | 1161 | 31 | No | 0 |
| Concentrated Solar | 200 | 1 | No | 0 |
| Run-of-River | 50 | 1 | No | 0 |
| Storage | 50 | 1 | No | 0 |

A modified RTS-GMLC system was used for the simulation.

TABLE III
MEAN TOTAL PAYMENTS TO GENERATORS (\$, THOUSANDS) BY GENERATION TYPE AND WIND OFFER STRATEGY

| Generators | Centralized Dispatch | | | Risk-Aware Wind Bids | | |
|-------------|----------------------|--------|--------|----------------------|--------|--------|
| | 25th | 50th | 75th | $\beta=0.25$ | 0.5 | 0.75 |
| Coal | 197432 | 195418 | 195407 | 189988 | 217076 | 207836 |
| Hydro | 91328 | 89724 | 89916 | 88084 | 101349 | 99549 |
| Gas (CC) | 236498 | 234349 | 224971 | 205979 | 238631 | 241216 |
| Gas (CT) | 72343 | 70984 | 73424 | 77706 | 79749 | 76999 |
| Nuclear | 45087 | 45204 | 44749 | 41504 | 47662 | 46026 |
| Oil (CT) | 49 | 44 | 70 | 0 | 1005 | 0 |
| Oil (Steam) | 183 | 182 | 182 | 183 | 183 | 185 |
| Wind | 32312 | 35289 | 24425 | -9647 | -610 | 10240 |
| Total | 675832 | 671284 | 652144 | 594297 | 684845 | 682051 |

TABLE IV
STANDARD DEVIATION OF TOTAL PAYMENTS TO GENERATORS (\$, THOUSANDS) BY GENERATION TYPE AND WIND OFFER STRATEGY

| Generators | Centralized Dispatch | | | Risk-Aware Wind Bids | | |
|-------------|----------------------|------|------|----------------------|------|------|
| | 25th | 50th | 75th | $\beta=0.25$ | 0.5 | 0.75 |
| Coal | 4146 | 4180 | 4320 | 3886 | 2825 | 1086 |
| Hydro | 2291 | 1954 | 1588 | 858 | 816 | 840 |
| NG (CC) | 3036 | 3077 | 3429 | 3431 | 2887 | 1528 |
| NG (CT) | 2404 | 2624 | 3257 | 3089 | 2671 | 1250 |
| Nuclear | 14 | 13 | 14 | 14 | 9 | 4 |
| Oil (CT) | 11 | 8 | 12 | 0 | 6 | 0 |
| Oil (Steam) | 0 | 0 | 0 | 0 | 0 | 0 |
| Wind | 7572 | 8160 | 9049 | 9138 | 6582 | 2331 |

- In certain risk-preference scenarios (low risk tolerance), wind generators lose money because their input estimates of market clearing prices are not accurate.
- Wind generators make more profit when the system operator dispatches them based on simple heuristics, but the variance in generator payments significantly increases to fast-response generators.
- The specific impacts of allowing generators to hedge in energy markets will be dependent on the mix of generation resources and system loading.

Methods

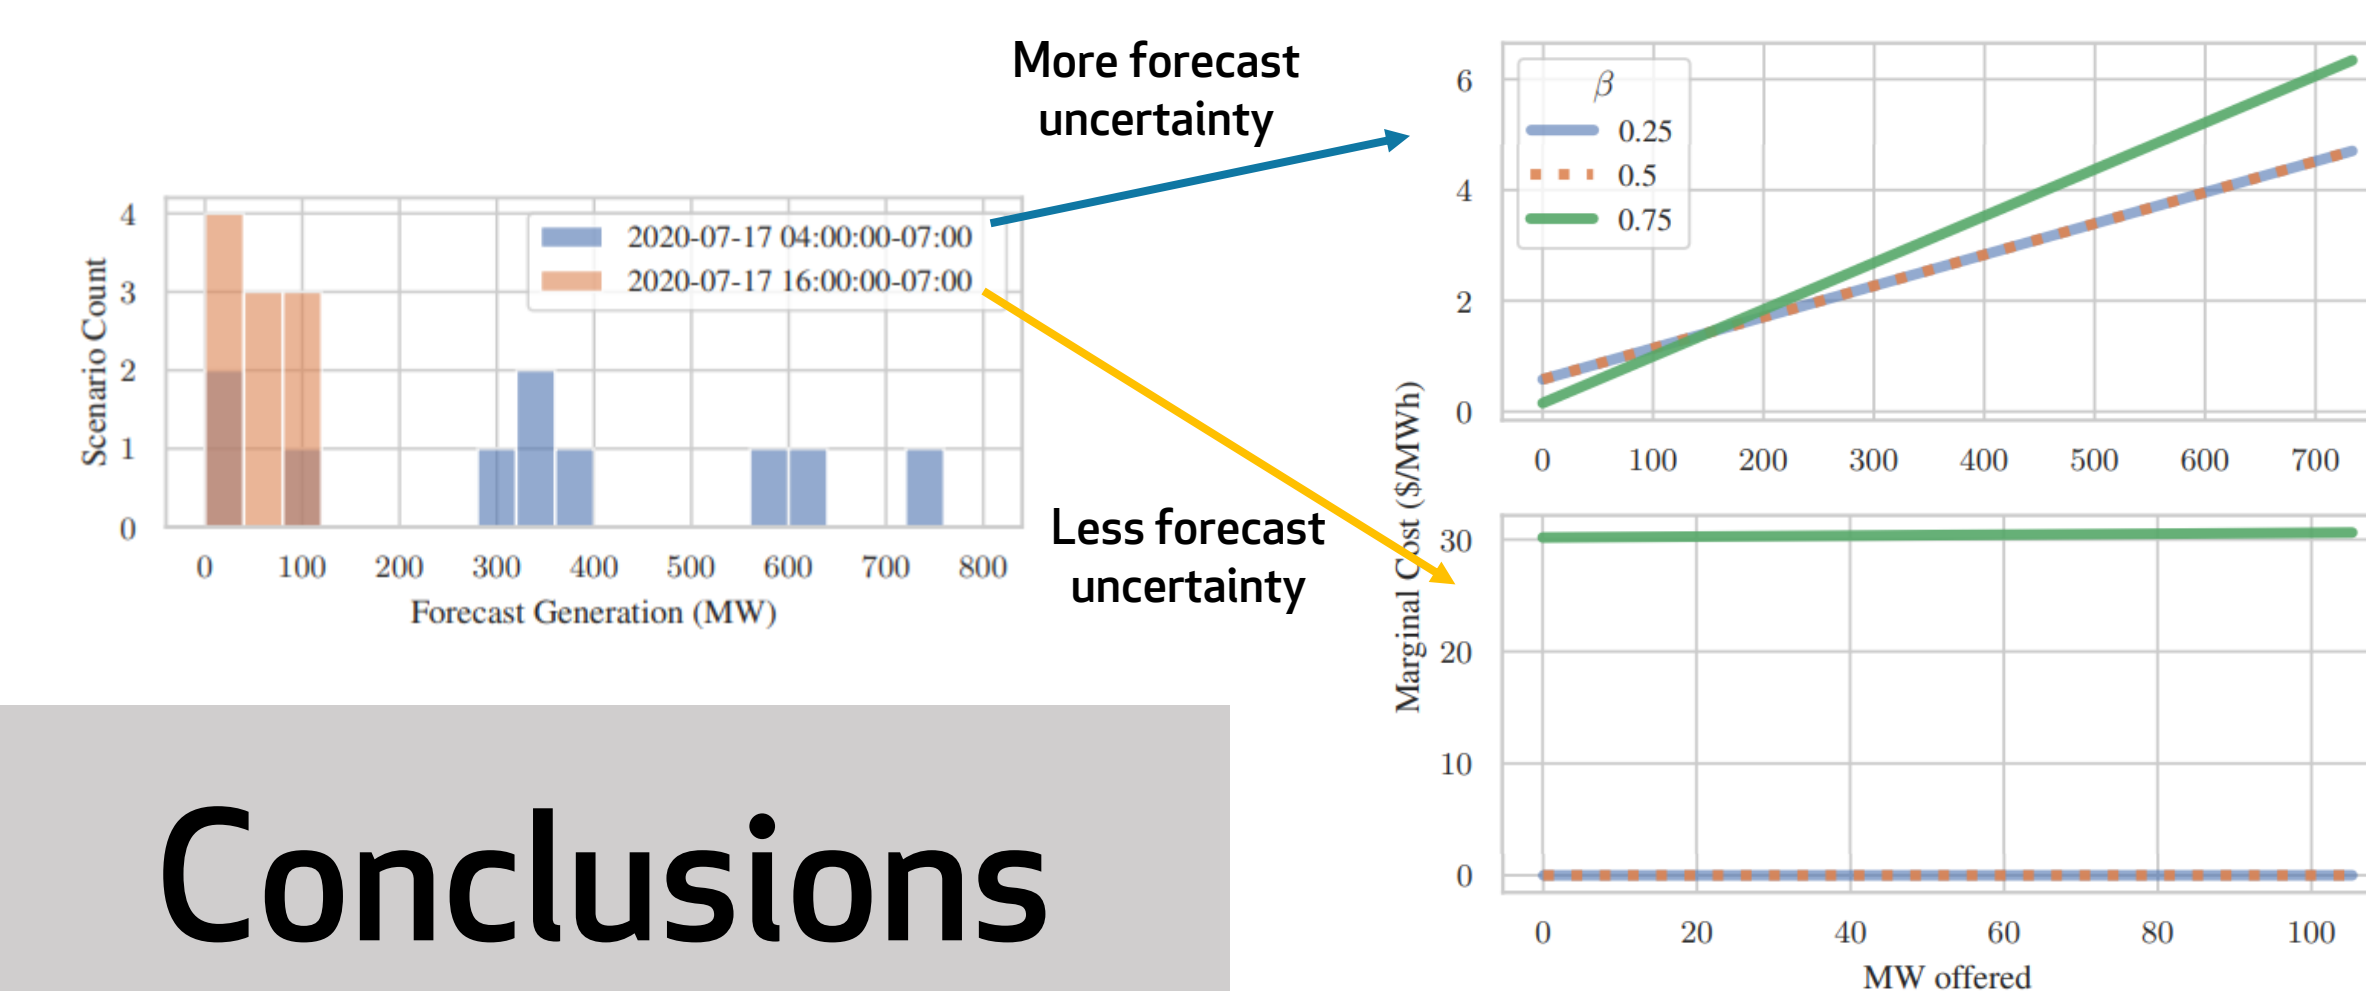

$$\max_{a,b} CVaR_{\beta, \lambda_{i,t}, \alpha_{i,t}} \left(\lambda_{i,t} \cdot \frac{\lambda_{i,t} - b}{2a} - \alpha_{i,t} \cdot \Delta \tilde{p} \right)$$

$$s.t. \quad a \geq 0$$

Risk Preference DA Clearing Price RT Clearing Price

- The generator determines coefficients a and b that characterize its marginal price offer as a function of MW: $[\$/MWh] = 2a + b$
- This offer is influenced by:
 - Revenue from the day-ahead market
 - Penalty from repurchasing shortfall in the real-time market
 - Generator risk preference
 - The distribution of forecasted wind power

Conclusions

- Possible to create offers that empirically reflect uncertainty-associated costs
- "Uncertainty-aware" offers empirically lower the variance in wind generator revenues, with the tradeoff of lower expected revenues; hedging works
- Multiday cycle simulations with learning of generator offer vs. market price needed to demonstrate effectiveness of hedging strategy & find Pareto frontier of expected system cost vs. variance in costs
